

New Course for Fall 2018

EECS 498-009

# Election Cybersecurity

Elections, the foundation of democracy, are increasingly subject to electronic attacks. Manipulation of social media, hacks against campaigns, and vulnerabilities in voting equipment create unprecedented risks.

This new course will examine the past, present, and future of election security, informed by perspectives at the intersection of computer science, law and public policy, politics, and international affairs.

We will study how elections can be attacked and work to help defend them, using a broad range of technical and public policy tools.

**Prof. J. Alex Halderman**

Lecture: Mondays 1:00-4:00

**CSE students and non-engineering majors are both invited to enroll.**
